------	--------	------	--------------------------

Molecular analysis for Qualitative detection of SARS-CoV-2 by RT PCR

(ICMR REGISTRATION NUMBER- SMLABA)

SPECIMEN:Nasopharyngeal swab and Oropharyngeal swab

Methodology- Real Time PCR

N gene (Ct)	Negative
Orf gene (Ct)	Negative
COVID19 INTERPRETATION	NEGATIVE

Interpretation of CT Value: High Viral Load: <17 - 24, Moderate Viral Load: 25 - 31, Low/Mild Viral Load: 32 - 37.

Test is not in scope of NABL Accreditation.

Test is performed on QuantStudio 5 / Biorad CFX 96 Real Time PCR Instrument

Test report should be correlated with the clinical presentation and findings.

A negative result does not rule out Covid-19 infection and should not be used as the sole basis for treatment or other patient management decisions.

A number of factors could lead to a negative result in an infected individual including:

- Poor quality of the specimen, containing inadequate patient material or non-representative specimen.
 - The specimen was collected late or very early in the infection. Optimum specimen types and timing for peak viral levels during infections caused by 2019-nCoV have not been determined. Collection of multiple samples from the same patient may be necessary to detect the virus.
 - The specimen was not handled and shipped appropriately.
 - Technical reasons inherent in the test, e.g Virus mutation or PCR inhibition.
 - Inadequate number of organisms are present in the specimen.
- Reports will be provided to the treating physician is requested to communicate the same to the patient and follow MOHFW policy for isolation, quarantine and treatment of all positive cases along with contact tracing as recommended.

Repeat sampling and testing of lower respiratory specimen is strongly recommended in severe or progressive disease.

The repeat specimens may be considered after a gap of 2-4 days after the collection of the first specimen for additional testing if required.

INVESTIGATION : MRI OF LEFT KNEE JOINT

SAGITTAL T2W & PD FAT SUPRESSED, CORONAL PD FAT SUPRESSED AND AXIAL T1W & AXIAL PD FAT SUPPRESSED IMAGES THROUGH LEFT KNEE JOINT HAVE BEEN OBTAINED ON 1.5 TESLA WITH HIGH STRENGTH GRADIENTS.

Articular cortex and subchondral bone of femur and tibia are unremarkable.
Articular cartilages show normal signal intensity and thickness.
Anterior and posterior cruciate ligaments appear normal.

Small medial meniscus. Deficient superior half of the meniscus from the anterior horn -body junction upto posterior horn-root junction [most likely secondary to underlying horizontal tear]. A displaced meniscal flap is noted in the intercondylar region [from anterior to posterior intercondylar region]. Mild intrasubstance high signal in the native meniscus. High intrasubstance signal noted extending in the posterior root fibres- likely partial tear.

Grade1 signal in posterior horn of lateral meniscus. No tear.

Medial & lateral collateral ligaments appear normal.
Patella, infra-patellar fat pad, patellar retinaculum and patello-femoral joint appear normal.
Quadricep tendon and patellar tendon appear normal.
Structures of popliteal fossa appear normal.

OPINION:

- **Small medial meniscus. Deficient superior half of the meniscus from the anterior horn -body junction upto posterior horn-root junction [most likely secondary to underlying horizontal tear]. A displaced meniscal flap is noted in the intercondylar region [from anterior to posterior intercondylar region]. High intrasubstance signal noted extending in the posterior root fibres- likely partial tear.**
- **Grade1 signal in posterior horn of lateral meniscus. No tear.**

MRI LEFT KNEE JOINT

MRI of the knee joint was performed using T1 and T2 weighted sequences in multiple planes.

FINDINGS

Attenuation and hyperintensity is noted in the anterior, posterior horns and body of medial meniscus with centrally displaced meniscal fragment suggestive of grade III Bucket handle tear. Lateral meniscus is normal.

Mild bone marrow edema is noted in posterior aspect of the lateral femoral condyle.

Mild joint effusion is noted.

Anterior cruciate ligament appears normal. Posterior cruciate ligament appears normal.

The medial collateral ligament appears normal. The lateral collateral ligament appears normal. Vastus medialis and lateralis tendons, iliotibial band, biceps femoris, popliteus and gastrocnemius-solius tendons are unremarkable.

The articular cartilage reveals normal intensity and is uniform in thickness.

Rest of the bones around the knee reveal normal intensity without any evidence of a focal lesion. The muscles and intermuscular planes appear normal.

IMPRESSION

- Attenuation and hyperintensity in the anterior, posterior horns and body of medial meniscus with centrally displaced meniscal fragment suggestive of grade III Bucket handle tear.
- Mild bone marrow edema in posterior aspect of the lateral femoral condyle.
- Mild joint effusion.
